

DISPLAY DEVICES HAVING ROUNDED CORNER
BACKLIGHT UNIT

Abstract of the Disclosure

5 A backlight unit for a display device includes a mold frame and a light guide panel. The mold frame includes a groove having at least one rounded corner. The light guide panel is on the mold frame and includes a light guide projection in the groove, having at least one rounded corner corresponding to the at least one rounded corner of the mold frame groove. ~~By rounding at least one corner, concentration of light in the display can be reduced to provide an improved quality display while still holding the light panel in the mold frame to prevent damage to the light source.~~
